

Carbondesh

Something Carbon. Something Bangladesh.

The world is pricing carbon.

The planet is warming. The response is a global carbon economy. Governments are putting a price on emissions. Companies are measuring, reporting, and disclosing their carbon footprint. Carbon credits are becoming a serious asset class. The voluntary carbon market, compliance markets, and the new Article 6 international carbon trade framework are together building a multi-trillion dollar carbon economy. Every tonne of CO₂ reduced or removed can be measured, verified, and traded.

Bangladesh is at its carbon moment.

Bangladesh is one of the world's most climate-vulnerable nations and one of its most carbon-rich opportunity landscapes. Bangladesh pre-launched its national carbon market framework at COP30 in November 2025. A Designated National Authority is operational. A national Carbon Registry is being built. Bilateral carbon agreements are active. Foreign investors are in feasibility studies. Bangladesh is ready.

A new carbon intelligence platform is here.

The professionals building Bangladesh's carbon market need structured, reliable, dedicated carbon intelligence. Decisions are being made that will shape this market for a generation. What is the DNA approving. Where the registry stands. Which bilateral agreements are moving. Which projects are in the pipeline. Who is investing and why. This intelligence does not exist today in any structured form. Carbondesh is being built to serve this need.
